

Hydrogen Risk Mitigation Through Fire and Gas Mapping

Jack Samways BEng MSc

Fixed Gas & Flame Detection - Business Development Manager - New Energy Europe

Agenda

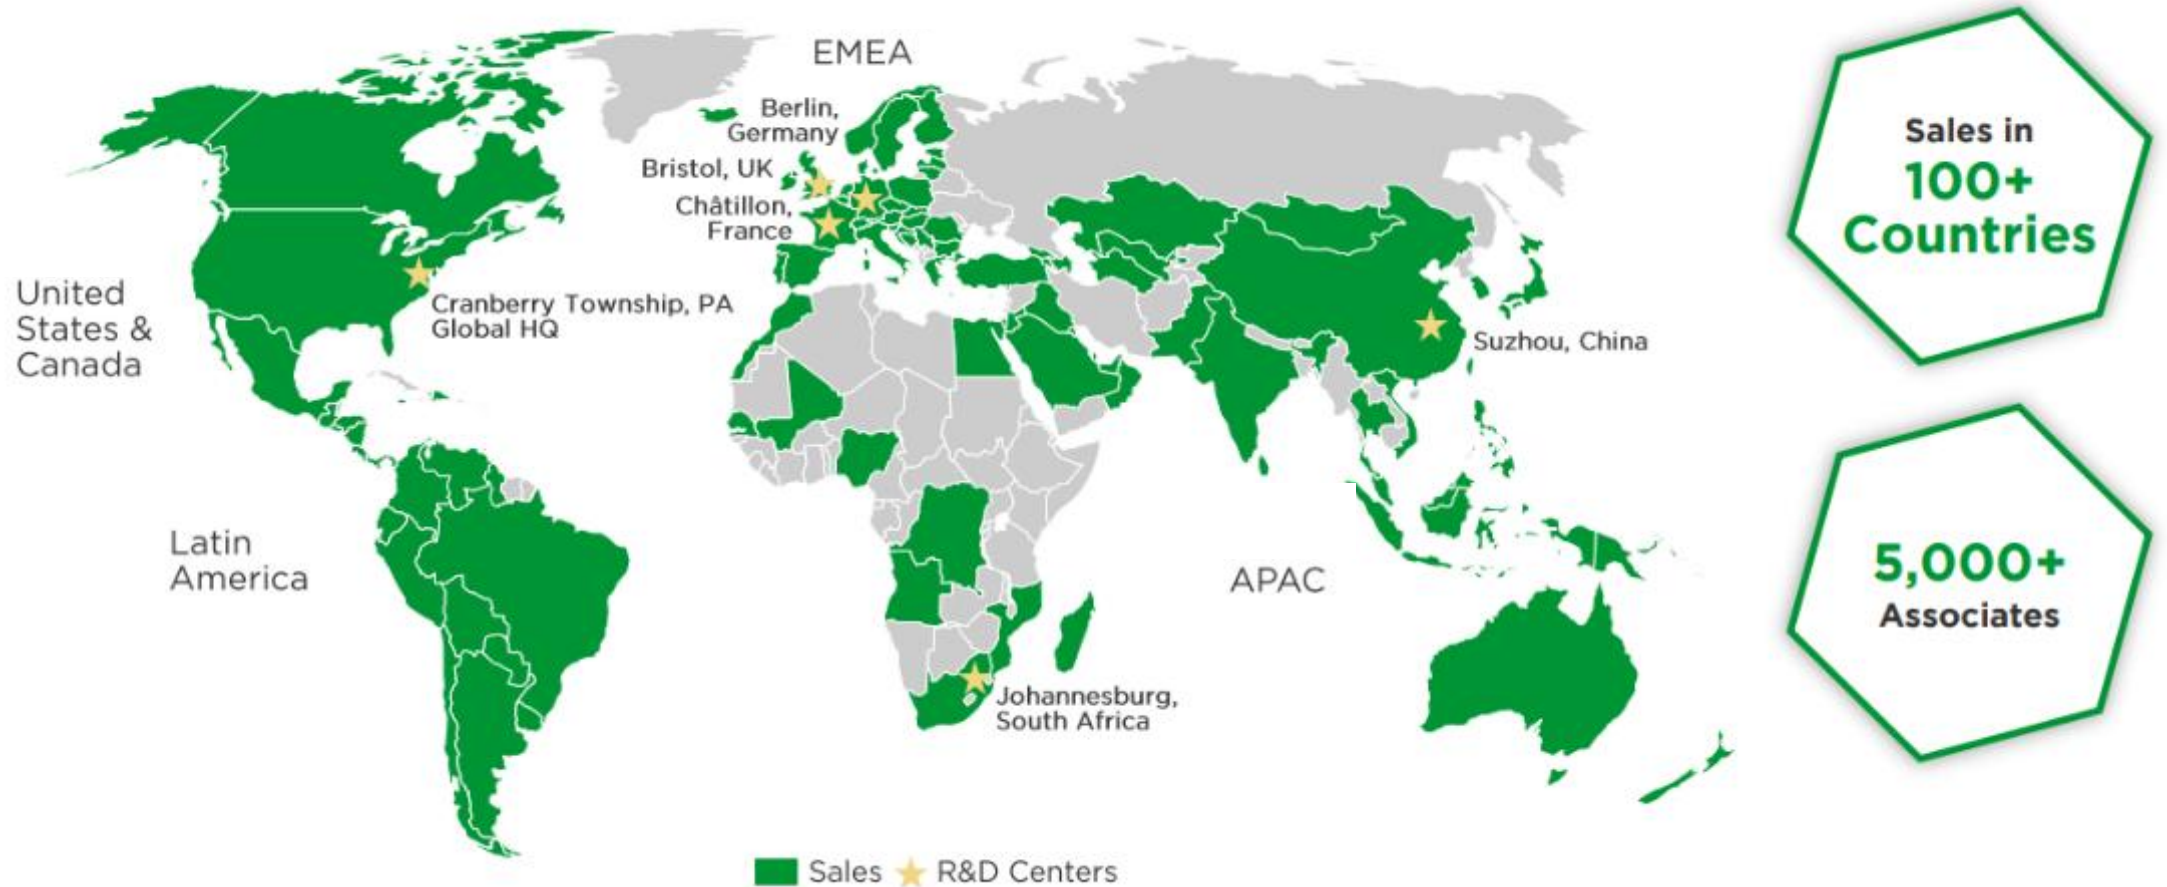

1. MSA Safety – Protecting Lives for 110 Years
2. Hydrogen Properties and Challenges
3. Fire and Gas Mapping – support for Hydrogen applications
4. Fire and Gas Detection – technology summary

Protecting Lives for 110 Years

Delivering innovative safety solutions globally

Leading positions in many areas of safety

DETECTION

Connected instrumentation to protect workers, enhance site safety, and increase operational efficiency

Fixed Gas & Flame Detection

Portable Gas Detection

FIRE SERVICES

Innovative products and solutions to help protect firefighters

SCBA & Connected Firefighter

Protective Apparel & Helmets

INDUSTRIAL PPE AND OTHER

Sophisticated solutions to enhance worker safety

Industrial Head Protection

Fall Protection

Hydrogen Challenges

What can help in managing the risk?

Hydrogen Properties and Challenges

HYDROGEN GAS CHARACTERISTICS

Flammability Range
4 – 77 Vol%

Ignition Energy
0.02 mJ

Invisible, Colorless,
& Odorless

HYDROGEN FLAME CHARACTERISTICS

Invisible
in Daylight

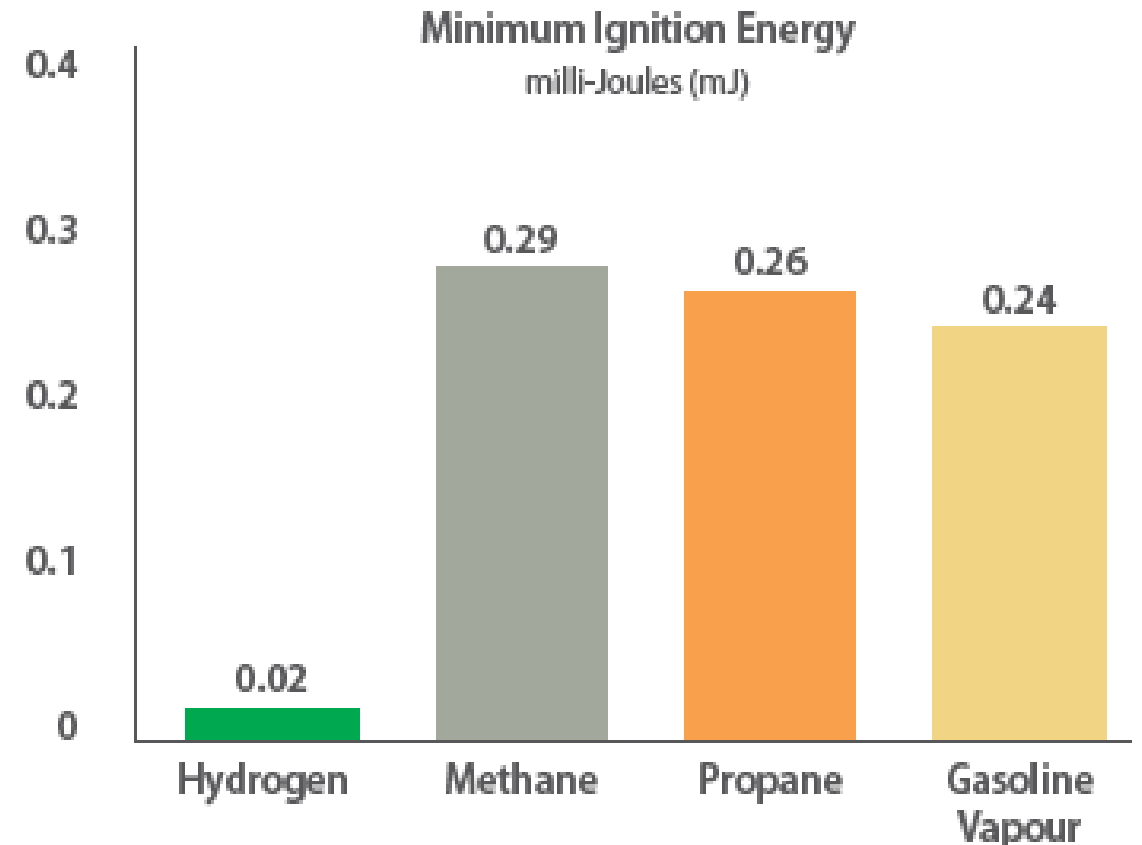

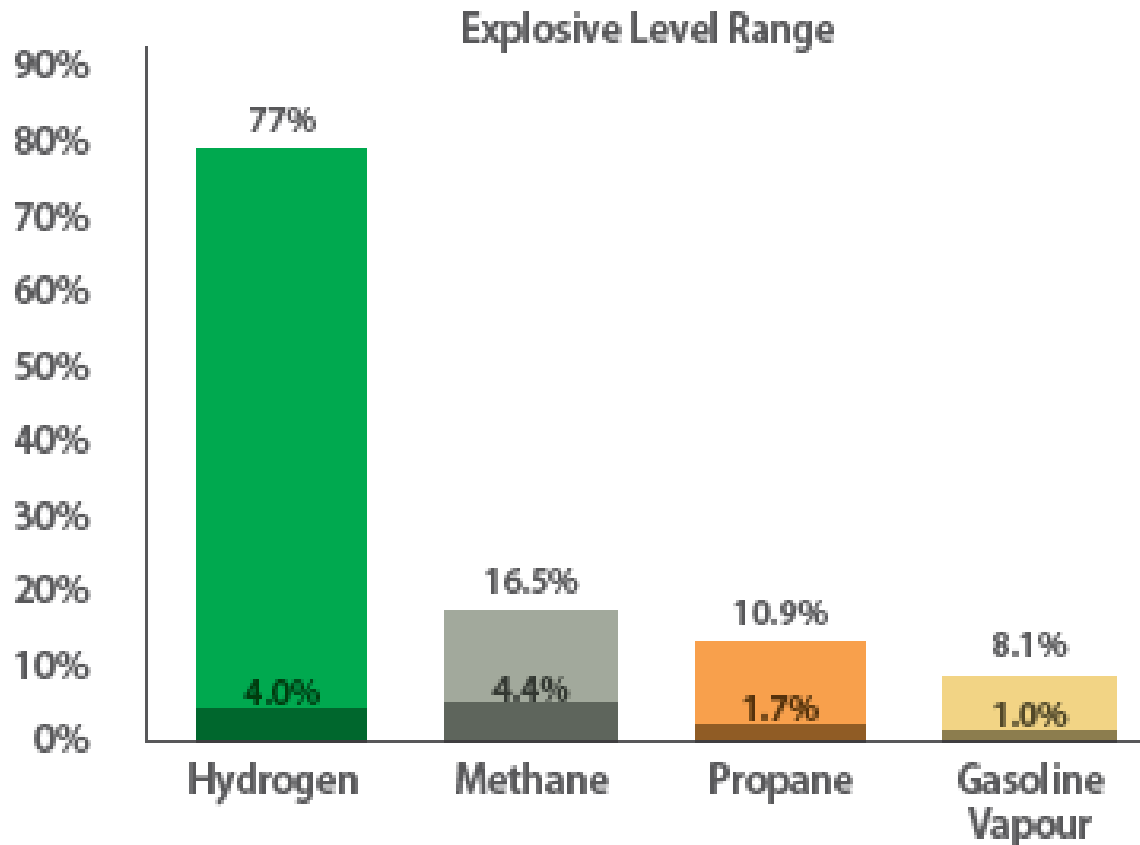

Low Thermal
Radiation

High Temperature
of 4,010°F (2,210°C)

- Challenging H₂ gas and flame properties require careful risks evaluation and reduction of those risks towards an acceptable risk profile.
- **Fire & Gas Mapping is a solution that assist in evaluations, considering the application, sensor technologies, detector placement, zoning, probability of alarming and voting.**

Hydrogen comparison to common fuels

Why we are emphasizing on Fire & Gas Mapping

Available standards on H₂ do not give enough guidance

Some of Existing Standard and Information About Fire And Gas Detection System / Instruments

| Standard | Description | Available information | Gap |
|------------------|---|--|--|
| ISO 22734-2019 | H2 Generator using water electrolysis - Industrial/Commercial and Residential | <ul style="list-style-type: none"> • ISO 22734-2019: Ventilation activates at 25% LEL (1% H₂ by volume). • IEC 60079-29-1: Defines detector performance, including response behaviour and vibration testing. • IEC 60079-29-2: Guidelines for detector maintenance. | <p>These standards do not provide guidance on where to install fire and gas detectors or on improving leak detection ratios, nor do they address emerging technologies for analysis and detection.</p> |
| ISO/TR 15916 | Basic Consideration for the safety of H2 System | General guidance of use of gas and flame detector in probable place of leak accumulation and ventilation duct | |
| ISO 26142-2010 | H2 Detection Apparatus Stationery Application | Advises to refer to IEC 60079-29-1 | |
| ISO 19880-1-2020 | Gaseous H2 Fueling Stations - General requirements | <ul style="list-style-type: none"> • Refer to IEC 60079 for area classification. • Highlight IEC 61508's role in safety. • Focus on mechanical protection, referencing ISO 22734 and ISO 26142. • Emphasise setting appropriate alarm thresholds. | |

Fire and Gas Mapping

Support for Hydrogen applications

Performance Target → Improving leak detection

- **Detection Coverage**

- Fraction of hydrogen gas release scenarios detected

- **Safety Availability (PFDavg)**

- Probability that a system will fail, and not be able to perform its safety function

- **Mitigation Effectiveness**

- Degree to which consequence is mitigated after successful activation

- Safety availability and mitigation effectiveness can be improved by selecting right kind of control system and field devices which will actuate the mitigation process.
- **However, the detection coverage is the main contributing factor for effectiveness of the entire system.**

Step 1: FGS Effectiveness Parameters

Event tree representation of fire and gas safety systems (FGS) effectiveness parameters

The ISA 84.00.07 approach employs a simplified category-based event tree analysis with a scoring system that will pick a gas detection “grade” as a function of the parameters that define risk, which include:

| | FGS Detector Coverage | FGS Safety Availability | FGS Mitigation Effectiveness | Relative Likelihood | Outcome |
|--------------------------|-----------------------|-------------------------|------------------------------|---------------------|-------------|
| Design Basis Hazard 1 | Yes | Yes | 0.9 | 0.70 | Mitigated |
| | Yes | No | 0.1 | 0.08 | Unmitigated |
| | No | Yes | 0.03 | 0.02 | Unmitigated |
| | No | No | 0.2 | 0.20 | Unmitigated |
| FGS Effectiveness | | | | 0.70 | |

- Equipment type – proxy for leak rate
- Degree of occupancy of area
- Likelihood of ignition of release
- Likelihood of early or immediate ignition
- Released material type – proxy for consequence magnitude
- Process pressure – modifier to consequence magnitude
- Degree of confinement – modifier to consequence magnitude

Step 2: Selection of Performance Grade

| Zone ID | Equipment Items | | | | | | | | Hazards | | | | |
|----------|-----------------|-----------------------|---------------------------------------|-------------------------------|---|---|--|---|-------------|-------------------|--------------|-------------|----------------|
| | Tag | Base Likelihood Score | Occupancy Factor | Environment Factor | Early Ignition Factor | Base Consequence Factor | Process Pressure Factor | Flammable Environment Factor | Hazard Code | Likelihood Factor | Cons. Factor | Hazard Rank | Selected Grade |
| Area 144 | ET-01/02/03 | Piping Manifold | High (Near Continuous Occupancy) >30% | Low Ignition Probability (3%) | Very Unlikely (No Credible Sources of Immediate Ignition) | Gas [T(process) > NBP or Cryogenic Liquids T(ambient) > BP] | Atmospheric to 50 psig (atm. To 3 bar) | Confinement / High Congestion (2D High) | Comb. Gas | 0.5 | 4.5 | 4 | B |

- Parameters are categorised, not numerically quantified.
- Categories are assigned scores, leading to an overall score.
- The overall score correlates to a performance target (e.g., gas detection grade).
- In the electrolyser case study, categories were selected for a closed facility housing

Step 3: Category Grade Definition

An example of grade as per ISA TR 84.00.07 for electrolyzer

| Hazard | Adjusted Hazard Rank | Grade | Detector Coverage | Safety Availability | Response Time |
|------------------------|----------------------|-------|-----------------------|---------------------|------------------------------|
| Fire Hazard | >=7 | A* | 0.90 | 99.9% | N/A |
| | 5 to <7 | A | 0.90 | 99% | N/A |
| | 2 to <5 | B | 0.80 | 99% | N/A |
| | 0.5 to < 2 | C | 0.60 | 90% | N/A |
| | <0.5 | N/A | No Detection Required | N/A | N/A |
| Combustible Gas Hazard | >=7.5 | A* | 0.90 | 99.9% | Rapid (10-30 sec) |
| | 5 to <7.5 | A | 0.90 | 99% | Rapid (10-30 sec) |
| | 2 to <5 | B | 0.80 | 99% | Early Detection (<60-90 sec) |
| | 0.5 to < 2 | C | 0.60 | 90% | Moderate (60-90 sec) |
| | <0.5 | N/A | No Detection Required | N/A | N/A |

Step 4: Dispersion Modeling/Concentration profile

CFD Model of Concentration Profile of Electrolyzer Hydrogen Release

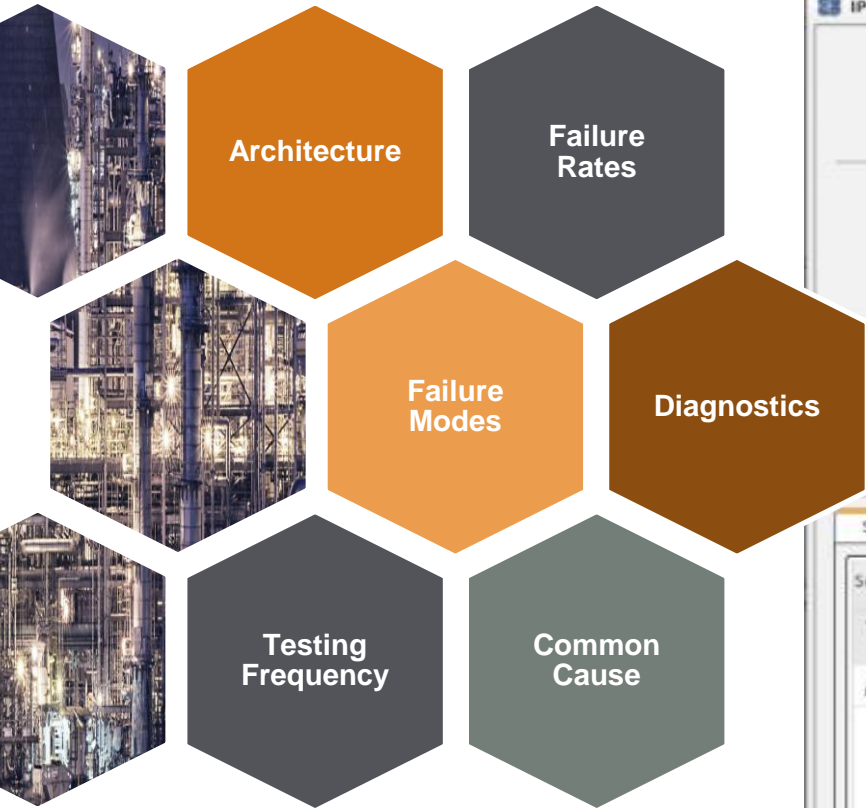

Step 5: Dispersion Modeling – Time to detect

Time to Detect Trends (CFD) – Confirm Response Time

Step 6: Confirm safety availability - PFD

KENEXIS VERTIGO PEM Electrolyzer Facility Signed in as Edward Marszal of Kenexis

IPF Details

Tag: UZC-100
 IPF Description: Hydrogen Leak Detection De-energizes Electrolyzer

IPF Type: SIF | Selected SIL: SIL 2 | Required RRF: 100 | Mode of Operation: Low Demand

IPF Notes: [Empty]

Input Group Logic: 1001 | Output Group Logic: 1001

Analyst Comments: [Empty]

Results - IPF

Achieved SIL? ● | Achieved RRF? ● | Achieved HFT? ●

| | |
|---|---------|
| Achieved SIL (PFD _{Avg}) | SIL 2 |
| Overall PFD _{Avg} | 4.51E-3 |
| Achieved RRF | 221 |
| Max SIL Approved | SIL 2 |
| Minimum Fault Tolerance Achieved | Yes |
| Overall MTTF-5 (yrs) | 13.1 |
| Dangerous Undetected Failure Rate (1/hrs) | 1.03E-6 |

Sensors | Logic Solvers | Final Elements | Recommendations | Revisions

Search Sensors in Study: All items checked + Add New Sensor

| Tag | Voting | SFF | Test Interval (Months) | PFD _{Avg} |
|----------------|--------|--------|------------------------|--------------------|
| <u>AIT-100</u> | 1001 | 92.1 % | 12 | 1.91E-3 |

Results - Sensor Subsystem

PFD_{Avg}: 1.91E-3 | STR (Per Hour): 5.09E-6 | Fault Tolerance: 0

100% | 80% | 60% | 40% | 20% | 0%

Contribution to Overall PFD_{Avg}

100% | 80% | 60% | 40% | 20% | 0%

Contribution to Overall STR

4 3 2 1 0

Max SIL Capable PFD_{Avg}

4 3 2 1 0

Max SIL Capable Fault Tolerance

What can we conclude?

What can we conclude?

- Gas detection SIFs are more complex than traditional SIFs as they mitigate the consequences of a loss of containment, rather than preventing it.

What can we conclude?

- Gas detection SIFs are more complex than traditional SIFs as they mitigate the consequences of a loss of containment, rather than preventing it.

- According to **ISA TR 84.00.07**, their effectiveness depends on three factors: PFD, coverage, and mitigation effectiveness.

What can we conclude?

- Gas detection SIFs are more complex than traditional SIFs as they mitigate the consequences of a loss of containment, rather than preventing it.
- According to **ISA TR 84.00.07**, their effectiveness depends on three factors: PFD, coverage, and mitigation effectiveness.
- Coverage refers to the probability of a detector being in a location where it can detect the gas cloud (e.g., if the gas cloud is blown away, the SIF won't function).

What can we conclude?

- Gas detection SIFs are more complex than traditional SIFs as they mitigate the consequences of a loss of containment, rather than preventing it.

- According to **ISA TR 84.00.07**, their effectiveness depends on three factors: PFD, coverage, and mitigation effectiveness.

- Coverage refers to the probability of a detector being in a location where it can detect the gas cloud (e.g., if the gas cloud is blown away, the SIF won't function).

- As hydrogen fuel technology advances, risk analysis will require gas and fire detectors to safeguard hydrogen generating and containing equipment. To ensure tolerable risk, these systems should comply with **IEC/ISA 61511** and be supplemented by **ISA TR 84.00.07** for guidance on detector quantity and placement.

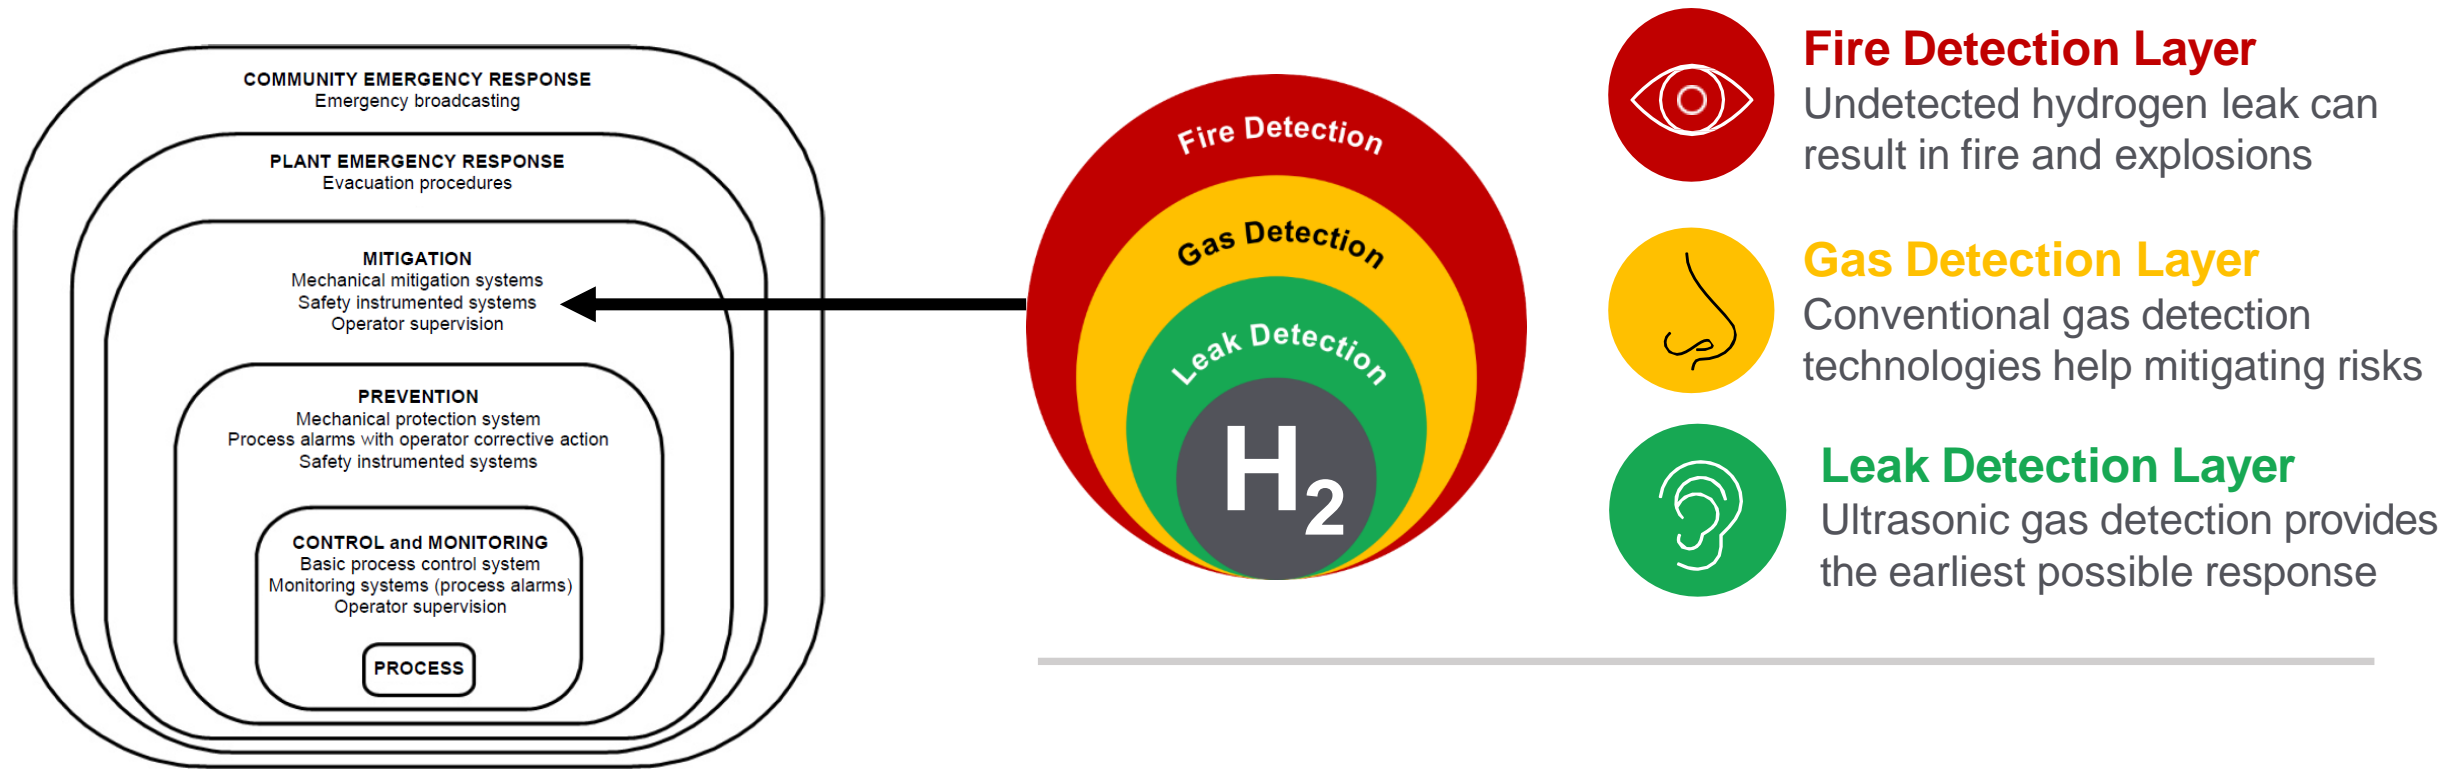

Gas and flame detection technologies

Quick review of layered protection

Protection layers and MSA approach

Gas and flame detection following the human sensory model

IEC 61511-1

Gas and flame detection layers applied

Event scenarios following a Hydrogen release

Gas and flame detection layers

Technology implementation

Ultrasonic detection

- 360° coverage
- 28m range
- ANN technology

Observer® i

Point detection

- 0-100% LEL range
- 0-1000 ppm range
- CatBead & EChem

ULTIMA® X5000

Flame detection

- 125° field of view
- 3sec response time
- UV/IR technology

FL500-H2
